

Callmate

Never Freeze - Say exactly what you need to say.

Document Type	Product Requirements Document (PRD)
Version	1.4 — Mute-Activated Input
Date	March 2026
Author	Riz / CyberBrands LLC
Status	READY FOR BUILD — Audit Complete
Platform	iOS (Android Phase 2)
Revenue Target	$2–5M ARR within 24 months

1. Executive Summary

Callmate is a mobile app that writes phone call scripts for people who experience anxiety, dread, or avoidance around making calls. The user describes the call they need to make. Callmate gives them a personalized opening line, a conversation flow, comeback scripts for likely responses, and a clean exit line — in under 10 seconds.

There is no dominant incumbent. The problem is universally recognized, widely discussed on TikTok and Reddit, and completely underserved by existing tools. ChatGPT can do this ad hoc, but there is no dedicated, designed experience built for this exact use case.

Apple Intelligence (iOS 18.1+) is a partial substitute — users can use Notes + Writing Tools to rewrite text in a professional tone. Callmate's differentiation is structural: a branching 5-section call script with IF THEY SAY X comebacks, formatted to hold on screen during a live call. That is not something Apple's general writing tools replicate. This distinction must be communicated in the first screen the user sees.

The business model is $4.99/month subscription with a 3-script free limit engineered to trigger in the first session — not over 30 days. TikTok-native distribution. Zero API dependency risk. The retention profile for this app is episodic, not daily, which means the paywall must fire fast: users who don't hit it in Session 1 may not return before they churn.

At realistic Day 30 retention of 6–8% (industry benchmark for utility/health apps), with a 9% free-to-paid conversion rate on active users who hit the paywall, the financial model remains viable. At 35,000 paying subscribers, Callmate generates $2.1M ARR. At 70,000 subscribers, $4.2M ARR. Both are achievable within 24 months given the size of the addressable audience and the virality of the content format.

ONE-LINER

Callmate writes your branching phone call script — with comebacks for what they'll actually say — so you never freeze, blank, or hang up early again. Apple Intelligence rewrites text. Callmate scripts your entire call.

2. The Problem

2.1 What People Experience

Phone call anxiety is one of the most commonly discussed behavioral patterns on TikTok and in online communities. An estimated 40% of millennials and Gen Z report actively avoiding phone calls. The behaviors are consistent:

- Rehearsing a call in their head for hours before making it
- Writing out what they want to say in a notes app
- Asking a friend, partner, or parent to make the call for them
- Hanging up before anyone answers
- Letting voicemails sit unanswered for days or weeks
- Fumbling mid-call, freezing, saying the wrong thing, then feeling embarrassed

This is not limited to clinical anxiety. The majority of sufferers have fully functional lives but experience disproportionate dread around a specific, avoidable task. The emotional cost is real: missed appointments, unresolved disputes, delayed medical care, lost money, landlord conflict, and chronic background stress.

2.2 The Specific Calls That Trigger It

The highest-anxiety call types, in order of frequency of discussion:

Call Type	Why It's Hard
Doctor / medical office	Fear of judgment, not knowing what to say, being transferred multiple times
Landlord / property management	Power imbalance, fear of conflict, not knowing rights
Customer service / complaints	Unpredictable responses, fear of being dismissed, long hold times
Calling a business to ask a question	Fear of asking something 'stupid,' not knowing what to say if they ask follow-up questions
Insurance company	Dense terminology, fear of being tricked, complex needs
Making a reservation	Simple but high self-consciousness in silence/hold moments
Calling in sick to work	Guilt, fear of sounding fake, not knowing how much to explain
Calling back a missed number	Unknown caller, no context, social ambiguity

Breaking up or confrontation calls	Emotional stakes, unpredictable reaction, fear of saying the wrong thing
Calling a contractor or service provider	Not knowing industry terms, fear of being quoted wrong, not knowing what to ask

2.3 Why Existing Solutions Fail

- ChatGPT / Claude: Works, but requires the user to prompt-engineer the right output, is not designed for this use case, has no call-specific UX, and is perceived as a general tool not a specific solution.
- Notes app: People already do this. It's manual, takes time, and doesn't account for dynamic branching (what if they say X).
- Therapy / anxiety apps: Too heavy. Clinical framing creates friction for people who don't see themselves as having a disorder.
- Asking someone else to make the call: Not always available. Shameful for many users.
- Avoidance: The default. The entire market is currently served by doing nothing.

3. The Solution

3.1 Product Overview

Callmate is a focused, single-purpose app. The user opens it, describes the call they need to make in plain language, and receives a complete script — personalized to their situation — in under 10 seconds. The script is structured, readable, and designed to be held in hand while on the call.

3.2 Core User Flow

#	Step	Detail
1	**Open the app**	Zero friction home screen. One input field. No login required for first use. Onboarding immediately prompts: 'What's a call you've been putting off?' — engineered to generate 2 scripts in Session 1.
2	**Describe the call**	Natural language. "I need to call my landlord about a broken heater that's been out for 3 weeks." 1–3 sentences max.
3	**Set tone (optional)**	Single tap: Professional / Assertive / Friendly / Firm. Defaults to Professional.
4	**Generate script**	AI generates the script in <10 seconds. Structured in sections: Opening → Main Ask → Their Likely Responses → Your Comebacks → Close.
5	**Use during the call**	Before the call connects, Callmate prompts: 'Put it on speaker so you can see this screen and type freely.' Speaker mode is the designed default — not a workaround. Script displayed in large, readable text on a fully visible screen. Both hands free: user can tap, scroll, and type without removing the phone from their ear. Phone stays unlocked with screen-always-on active.
6	**Save / rate**	One tap to save to history. Stars to rate how the call went. Optional note. Builds the history data moat over time.

3.3 Script Structure

Every generated script follows this format:

SCRIPT FORMAT

OPENING: "Hi, my name is [name] and I'm calling about [reason]."

MAIN ASK: Exactly what you need to say to make the request clearly.

IF THEY SAY X: Your response if they push back, transfer you, or ask a question.

IF THEY SAY Y: Alternate branch for a second likely scenario.

CLOSE: A clean, professional exit line regardless of outcome.

3.4 AI Prompt Architecture

The AI backend (Claude API) receives a structured prompt including: the user's description, their selected tone, a list of common call types for context-injection, and a strict output format specification. The system prompt enforces the five-section structure and calibrates formality to the tone selection.

Critically: scripts are never generic. The AI must incorporate the specific details the user provided — the landlord's name if given, the duration of the problem, the specific ask — into the opening line and the main ask. Generic scripts are product-killing. This is enforced at the prompt level.

3.5 Premium Features (Paid Tier)

- Unlimited script generations (free tier: 3/month)
- Script history — saved and searchable
- Practice Mode — AI reads back the script in a simulated call environment

- Custom personas — "My boss," "My difficult mother-in-law" — saves context for recurring call types
- Real-time coaching — post-call reflection prompts: "How did it go? What would you change?"
- Voicemail mode — generates a voicemail script if they don't answer
- Email fallback — if the call fails, one tap generates a follow-up email

4. Incoming Calls & Live Branching

The original product design covered one scenario: a user who knows in advance they need to make a call and has time to prepare. Three additional high-anxiety scenarios were identified that the product must also address:

- Someone calls the user unexpectedly — no preparation time
- The user is mid-call and the conversation takes an unanticipated turn not covered by the script
- The user wants to add a new branch to their script before or during the call

Each scenario has a different time constraint and a different acceptable level of UI interaction. The design principle throughout: the user may be on a live phone call with one hand occupied and high anxiety. Every interaction must work with one thumb, in under 3 seconds, with a glance — not a read.

4.1 Incoming Call Mode

The Problem

An unexpected incoming call is the highest-anxiety scenario for this user base. They have seconds to decide whether to answer, and if they answer, no script, no preparation, and full social pressure to respond immediately. The current default behavior is either declining (avoidance wins) or answering and freezing.

The Solution: Incoming Call Kit

Callmate maintains a persistent set of four universal lines on the home screen — always visible, zero generation time required. These are not AI-generated in the moment; they are pre-written, field-tested responses that cover the four most common unexpected call scenarios. The user can tap any of them in one second while the phone is still ringing.

Situation	Pre-Written Safe Line
I need a moment to collect myself	*"Hi! Thanks for calling. Give me just one second to pull something up." (Buys 10–15 seconds of silence.)*
I'm not ready and need to reschedule	*"Hi, I'm actually in the middle of something — can I call you back in about 10 minutes? I want to give you my full attention."*

I don't recognize the number / need context	*"Hi, thanks for calling. Can I ask who I'm speaking with and what this is regarding?" (Neutral, professional, buys context without revealing you weren't expecting the call.)*
The call is going badly and I need to exit	*"I want to make sure I handle this properly — let me pull up the relevant information and call you right back within the hour." (Clean, professional exit for any scenario.)*

Quick Triage (When There Are 5–10 Seconds Before Answering)

If the user sees an incoming call from a known contact and has a few seconds, a swipe gesture from the home screen opens the Quick Triage flow — a 2-tap sequence that generates a minimal context-aware opener before they answer:

- Tap 1: Relationship — Work / Personal / Unknown
- Tap 2: Likely topic — 3 options based on call history with that contact or category defaults
- Result: A 2-sentence opener generated in 5–8 seconds, displayed as the user answers

DESIGN NOTE

Quick Triage is Phase 2 — it requires contact integration and call history. The Incoming Call Kit (4 pre-written safe lines) is MVP. It solves 80% of the problem with zero AI generation time.

4.2 Mid-Call: Unanticipated Branch

The Problem

The user is on a call, script visible. The other person says something the script didn't cover — a transfer, an unexpected question, a refusal, a completely off-topic tangent. The user freezes. The script is no longer useful. There is no obvious next action.

The Solution: Panic Button + Quick Response Taps

The script screen has a persistent large button at the bottom, always visible regardless of scroll position:

THE PANIC BUTTON

Label: "They said something unexpected" — large, high-contrast, thumb-sized. One tap opens the Live Response Panel without leaving the script view.

The Live Response Panel presents Quick Response Taps organized into four categories. The user taps one category, then one specific scenario — two taps total, generating a contextual response in 5–8 seconds using the original call context. Covers approximately 85–90% of unanticipated call pivots with no typing required.

Category	Quick Response Tap	What it generates
🚫 Pushback	They said no / pushed back	Calm, firm response that doesn't concede but doesn't escalate. Keeps the door open.
🚫 Pushback	They got defensive or upset	De-escalating language that acknowledges their reaction without backing down from the ask.
🚫 Pushback	They said 'that's not my problem'	Redirects responsibility clearly and professionally without sounding aggressive.
🔀 Transfer	They're transferring me to someone else	Re-opening line for the new person — re-establishes the full context from scratch, naturally.
🔀 Transfer	They put me on hold	Short script for when they come back — recaps the situation in one sentence so neither party has to restart.
❓ Question	They asked me something I can't answer	Graceful 'I'll find out and get back to you' that sets a specific follow-up expectation without sounding evasive.
❓ Question	They asked for information I don't have ready	Buys time professionally — 'Let me pull that up' — without revealing unpreparedness.
❓ Question	They asked why it took me so long to call	Non-defensive, natural explanation that doesn't over-explain or apologize excessively.
🏁 Exit	I want to end the call — it went well	Warm, clear close that confirms next steps and ends positively.
🏁 Exit	I want to end the call — it's unresolved	Professional close that leaves the situation open without committing to anything prematurely.
🏁 Exit	I want to end the call — it went badly	Neutral, controlled exit that doesn't burn the relationship, even if the outcome was poor.
🏁 Exit	They won't stop talking / I can't get off	Polite but firm interruption script that closes the call without being rude.

Custom Description (Fallback for Anything Else)

Below the Quick Response Taps, a fifth option: a text field labeled "Describe what they said" with a large keyboard and a prominent send button. The user types a brief description of the unexpected turn — the AI generates a response using the original call context plus the new information. On speaker with both hands free, typing 10–15 words takes under 15 seconds. This is the fallback for the 10–15% of scenarios the Quick Response Taps don't cover.

Phase 2 upgrade: Mute-Activated Input. Voice Whisper was considered and rejected — on a speakerphone call, the mic is open and capturing the other person's voice, ambient room audio, and the user simultaneously. There is no clean way to isolate a whisper from the ongoing call audio on a single device without muting the call first.

The correct solution is to treat mute as the activation signal. People already mute calls instinctively when they need a private moment — it is an established, natural behavior. Mute-Activated Input makes that behavior purposeful: when Callmate detects the user has muted the call (via the iOS CallKit mute state API), the input panel slides up automatically. The user types or dictates their description of the unexpected turn. Callmate generates the response. The user reads it, then unmutes and uses it. The other party experiences a brief silence — which is normal and unremarkable on any call.

WHY NOT VOICE WHISPER

On a speakerphone call, the mic captures everything: the other person's voice from the speaker, room noise, and the user's voice — all mixed together. There is no reliable way to extract a clean whisper from that combined audio without dedicated hardware (like a directional close-mic earbud). Voice Whisper was removed from the roadmap. Mute-Activated Input solves the same need without the technical conflict.

4.3 Adding a New Branch (Pre-Call or Post-Unexpected)

Pre-Call Branch Expansion

After the initial script is generated, a persistent "+ Add a branch" button appears below each IF/THEN section. The user types a specific scenario they're worried about — "What if they ask why it took me so long to call?" — and the AI appends a new IF THEY SAY / YOUR RESPONSE block to that section of the script. Can be done calmly before the call with no time pressure.

Post-Unexpected Branch Saving

When a user uses a Quick Response Tap or types a custom description during a live call, the AI-generated response is automatically saved as a new branch in that script. After the call, the user sees their original script plus all the branches that were added mid-call — building a richer, more battle-tested script for future similar calls. This is the data flywheel: every unexpected scenario the community encounters makes future scripts smarter.

4.4 Full Live Call UX Summary

Feature	Use Timing	Friction	Phase
Incoming Call Kit	Phone ringing (0–3 sec)	Zero — pre-written, one tap	**MVP**
Quick Response Taps	Mid-call pivot (0–3 sec)	Zero — one tap, 4 options	**MVP**
Custom Description input	Mid-call pivot (10–20 sec)	Very low — both hands free on speaker, type freely	**MVP**
Add a Branch	Pre-call planning	Very low — type freely, no time pressure	**MVP**
Quick Triage	Incoming call (5–10 sec)	Very low — 2 taps	Phase 2
Mute-Activated Input	Mid-call pivot (10–20 sec)	Very low — mute fires automatically, type or dictate privately	Phase 2
Branch Auto-Save	Post-call	Zero — automatic	Phase 2
Community Scripts	Pre-call research	Low — browse anonymized patterns	Phase 3

PRODUCT INSIGHT

The designed usage model is phone on speaker, face-up on a desk or held loosely in one hand. Both hands free. Screen always visible. This is not a constraint — it is a feature. It means the user can read, scroll, tap, and type freely during a live call. Every UI decision in Callmate is made against this baseline. The Incoming Call Kit and Quick Response Taps expand the product from 'pre-call prep tool' to 'full call companion.' On speaker, 'I got a surprise call from my landlord and typed a response while it was ringing' is a completely natural interaction — and a strong TikTok content hook.

5. Market Opportunity

5.1 Target User

Primary	Millennials and Gen Z (ages 18–38) who actively identify with phone call anxiety. Skews female slightly (60/40). Urban. Smartphone-native. TikTok users.
Secondary	Adults with ADHD, autism spectrum, or social anxiety who have specific difficulty with unscripted verbal communication.
Tertiary	Non-native English speakers making calls in English — high-stress, high-stakes, specific need for scripted language.
Latent	Anyone who has ever rehearsed a call, asked someone else to make a call, or delayed a necessary call. Estimated 80M+ US adults.

5.2 Revenue Model

Tier	Price	Features	Goal
Free	$0	3 scripts/month, no history	Top-of-funnel, viral content driver
Monthly	**$4.99/mo**	Unlimited scripts, history, personas	Core revenue driver
Annual	**$39.99/yr**	All monthly features + Practice Mode	LTV maximizer

5.3 ARR Scenarios

Scenario	Paying Subscribers	Avg Revenue/User	ARR
Conservative (12 mo)	12,000	$4.99/mo	**$719K**

Base (18 mo)	28,000	$4.99/mo	**$1.68M**
Target (24 mo)	60,000	$4.99/mo	**$3.59M**
Upside (36 mo)	100,000	$4.50 blended	**$5.40M**

RETENTION ASSUMPTION

These scenarios are modeled at 6–8% Day 30 retention (industry benchmark for utility/health apps) with 9% free-to-paid conversion on users who hit the paywall. V1.0 of this PRD used 12–25% Day 30 retention — that was aspirational. These numbers use the realistic floor. The business still works at the floor. If onboarding engineering pushes more users to the paywall in Session 1, upside is significant.

6. TikTok Distribution Strategy

6.1 Why This is a TikTok-Native Product

Phone call anxiety content is one of the most-discussed behavioral patterns on TikTok. Searches for "phone call anxiety," "calling anxiety," and "I hate making phone calls" generate hundreds of millions of combined views. The community actively creates content about this exact problem — meaning Callmate doesn't need to build an audience from scratch. It needs to show up inside a conversation that's already happening at massive scale.

6.2 Core Content Formats

Format	Hook / Structure	Why It Works
The Freezing Moment	*Open with: "I have to call my doctor tomorrow and I've been rehearsing it in the shower for 3 days." → Show the app generating a script in real time → Relief reaction.*	Maximum relatability. Comments flood with 'this is literally me.' Pure UGC fuel.
Script Reveal	*Faceless phone screen. Person types in their situation. Script appears line by line with dramatic timing. No talking needed.*	The Kaml Abdel-Kader 'Sum Puff' format. Curiosity loop drives completion. Easy to make at scale.
Before / After	*Before: person visibly anxious, fumbling on the phone, saying um. After: same person on phone, calm, script visible on screen, resolves the situation cleanly.*	Transformation arc — the highest-converting TikTok format for any behavioral app.
Duet / Stitch Bait	*Post a video: 'Rate how anxious this call would make you 1-10' with a list of call types. Comments become content. Duets create endless derivative posts.*	Zero production cost. Community generates distribution.
The Win	*"I've been avoiding calling my insurance company for 6 months. I used Callmate to write the script. I just got off the phone. They're covering it. Here's the script I used."*	Social proof + outcome. The highest-converting testimonial format on any platform.

6.3 Distribution Advantages Specific to This Founder

- @dronespace (122K+ followers): Existing audience and content distribution infrastructure. Cross-promotional credibility.
- Experience with visual product demos: Drone content is inherently visual and demo-driven — same skill set applies directly to app demos.
- Solo founder narrative: "I built this because I used to make my wife call the doctor for me" — authentic founder story is a TikTok-native content genre.

6.4 Hashtag & Community Strategy

- Primary: #phonecallanxiety (existing large community)
- Secondary: #adultinghard, #socialanxiety, #anxietytips, #adulting
- ADHD adjacent: #adhd, #adhdtiktok (massive overlap in phone anxiety audience)
- Avoid: clinical anxiety hashtags (too heavy, wrong demographic tone)

7. Competitive Analysis

Competitor	What They Do	Gap	Threat Level
Apple Intelligence **(iOS 18.1+ Writing Tools)**	Built into every iPhone 15 Pro+. Writing Tools can rewrite Notes text in Professional tone with ChatGPT integration. Free, zero friction, already installed.	Does NOT generate a branching call script. No IF THEY SAY X structure. No call-specific UX. No on-screen call companion mode. General text rewriting ≠ call preparation tool. Must be clearly communicated in onboarding.	**HIGH — the most underdiscussed threat. Every iPhone 15 Pro+ user already has a partial substitute. Callmate must win on structure and UX specificity, not AI quality.**
ChatGPT / Claude	General purpose AI that can generate scripts on request	Not designed for this. No UX for call use case. No history. Requires prompt engineering. Most anxious users don't have an active ChatGPT subscription open when they need a script.	MEDIUM — the 'good enough' risk. Solved by superior UX, dedicated experience, and the paywall triggering before the user thinks to open ChatGPT.
SpeakHints	Real-time AI speaking suggestions during live calls, meetings, and interviews (iOS + Mac, launched Dec 2025)	In-call prompting, not pre-call scripting. Different job to be done. No branching script structure. No anxiety-specific positioning.	LOW-MEDIUM — adjacent product, different use case. Signals the space is active. Watch for feature expansion.
Wysa / Woebot	Mental health chatbot apps	Clinical framing, not call-specific, subscription for different use case	LOW
Notes App (native)	iPhone / Android default notes	No AI, no structure, no branching, no history — the behavior Callmate replaces	LOW — existing behavior we're upgrading
Future copycat	Someone copies Callmate after it goes viral	Time advantage + brand advantage + call history data moat (script history becomes sticky over months)	**HIGH after 12 months — build fast and build brand**

MOAT STRATEGY

Apple Intelligence is the most underrated threat: it's already on every iPhone 15 Pro and costs zero. Callmate's answer is not better AI — it's better structure (5-section branching script), better UX (held on screen during a live call), and better positioning (call anxiety, not general writing). The first screen every user sees must answer: 'Why not just use Apple Intelligence?' The answer: because Apple Intelligence rewrites text. Callmate scripts your entire conversation, including what to say if they push back.

8. Feature Specification

8.0 Core UX Principles

Every feature in Callmate is designed against a single baseline assumption: the user is on speaker phone, phone face-up on a desk or held loosely in one non-dominant hand. Both hands are available. The screen is fully visible at all times. This is not an edge case — it is the designed and actively prompted usage mode.

Principle	How It Applies
Speaker mode is the default, not a tip	The Speaker Mode Prompt appears every time the script screen opens (first 5 sessions). It is treated as required onboarding for the product to function as designed — not a helpful suggestion.
Screen stays awake	Screen Always-On activates automatically when a script is open. The user should never have to unlock their phone mid-call.
Both hands free → typing is viable	Mid-call text input is a first-class interaction, not a desperate fallback. Input fields are large. The keyboard layout is optimized for speed, not precision. Send button is thumb-sized and obvious.
Anxiety is high — large targets, low steps	Even with two hands free, the user's fine motor control and attention may be impaired by stress. All tap targets are oversized. No interaction requires more than 2 steps. Critical buttons (Panic Button, Quick Response Taps) are always visible regardless of scroll position.
Fast generation over rich generation	Scripts must appear in <10 seconds. A good script in 7 seconds beats a great script in 15. Generation time is a UX constraint, not an engineering nice-to-have.
Mute = private input signal	In Phase 2, when the user mutes the call, Callmate detects the mute state via CallKit API and automatically slides up the input panel. The user types or dictates a description of the unexpected turn privately. The other party hears a normal brief silence. Muting is already instinctive behavior — Callmate makes it purposeful.

SPEAKER MODE IS THE PRODUCT

Every UX decision in Callmate assumes speaker mode. Features that would be impractical with one hand pressed to an ear — mid-call typing, scrolling through branches, adding new responses — become natural interactions when the phone is face-up on a desk. The Speaker Mode Prompt is not optional polish. It is the mechanism that makes the entire product work as designed.

- Onboarding flow — 'What's a call you've been putting off?' prompt on first launch. Generates 2 scripts before Session 1 ends, using 2 of 3 free credits immediately. Paywall fires during the same session while value is fresh.
- Apple Intelligence differentiation screen — shown before first script generation: 'Unlike Apple's Writing Tools, Callmate gives you a full branching script with comebacks for what they'll actually say — formatted to read on screen while you're on the call.'
- Speaker Mode Prompt — shown every time the user opens the script screen for a new call: 'Put it on speaker. You'll have both hands free to read and type.' Dismissable after 5 sessions. This is not a tip — it is the designed usage mode.
- Screen Always-On — screen stays awake automatically whenever a script is open. No lock screen interrupting a live call. Active as long as the script view is visible.
- Call description input — natural language, free text, 3 sentence max
- Tone selector — Professional / Assertive / Friendly / Firm (4 options, single tap)
- Script generation — 5-section branching output in <10 seconds
- Script display — large readable text, sections collapsible, full-screen mode. Designed for a phone face-up on a desk or held in one hand while on speaker — not pressed to the ear.
- Mid-call text input — because the user is on speaker with both hands free, typing a custom response during a call is a normal interaction, not a last resort. Input field is large, keyboard-friendly, with a prominent send button.
- 3 free scripts/month gate — hard paywall after 3. Engineered to trigger in Session 1 via onboarding, not after 30 days.
- Subscription purchase flow — RevenueCat integration, monthly + annual
- Basic history — last 10 scripts saved, no search (free tier shows last 3)
- Share sheet — screenshot-friendly script card for sharing

8.2 Phase 2 Features (Months 3–6)

- Mute-Activated Input — when the user mutes the call, Callmate detects mute state via iOS CallKit API and automatically slides up the input panel. User types or dictates a description privately. The other party hears normal silence. Unmuting dismisses the panel. This replaces Voice Whisper, which was removed — on a speakerphone call the mic captures all audio simultaneously and there is no reliable way to isolate a whisper from the live call audio on a single device.

- Quick Triage for incoming calls — 2-tap context setter (Relationship → Likely Topic) that generates a brief opener in 5–8 seconds while the call rings. Requires contact integration.
- Branch Auto-Save — unexpected pivots handled via Quick Response Taps or Custom Description are automatically appended to the original script as new branches after the call. Script history builds over time.
- Practice Mode — AI reads the script back, user responds, AI coaches on delivery
- Personas — save recurring contacts with relationship context
- Post-call rating — 1–5 stars, optional note, feeds call history
- Voicemail script variant — separate output format for leaving a message
- Email fallback — one-tap generation of follow-up email after failed/difficult call
- Confidence Tracker — 'You've completed 47 calls you were dreading. Here's how your scores have trended.'
- Call streak / milestone badges — gamified retention layer to counter episodic usage churn
- Widgets — iOS lock screen / home screen with today's pending call reminder

8.3 Phase 3 Features (Months 6–12)

- AI phone call coaching — listen-only mode, real-time script highlighting as conversation progresses
- Community scripts — anonymized, popular scripts for common call types ("How others called their insurance about X")
- Streak / habit tracking — "You've made 12 calls you were dreading this month"
- Team / family plan — share a subscription, one account for partner/family

8.4 Technical Architecture

- Frontend: React Native (iOS-first, Android Phase 2)
- AI: Anthropic Claude API (claude-sonnet-4-6 or equivalent) — system prompt enforces script structure
- Auth: Sign in with Apple (required for App Store)
- Payments: RevenueCat (handles iOS/Android subscription management, analytics)
- Storage: Local + iCloud sync (no server-side user data required for MVP — minimizes liability)
- Analytics: PostHog or Mixpanel (free tier sufficient for MVP)
- Backend: Minimal — API proxy layer to protect Claude API key, rate limiting

9. Success Metrics

Metric	Month 3	Month 12	Month 24
Total Downloads	8,000	150,000	**600,000**
Paying Subscribers	350	12,000	**60,000**
MRR	$1,747	$59,880	**$299,400**
Free → Paid Conversion	6%	9%	**9%**
Day 7 Retention	18%	22%	**28%**
Day 30 Retention	6%	7%	**8%**
Avg Scripts/User/Month	2.5	3.5	**4.0**
TikTok Followers	5,000	80,000	**250,000**

10. Risks & Mitigations

Risk	Probability	Mitigation
Apple Intelligence erodes differentiation as iOS writing tools improve	**HIGH — already partially true**	Callmate's moat is structure + UX, not AI quality. The 5-section branching script and on-screen call companion are not replicated by Writing Tools. Communicate this on first launch and in all marketing. Monitor Apple Intelligence updates closely.
Episodic usage → low Day 30 retention → paywall never fires	**HIGH if onboarding is passive**	Engineer onboarding to generate 2 scripts in Session 1, consuming 2 of 3 free credits immediately. Paywall must fire during first session while value is freshest. Every week of delay in hitting the paywall = more churn before conversion.
'Use case solved' churn — users improve, stop needing the app	**MEDIUM**	Phase 2 Confidence Tracker converts the product from 'anxiety tool' to 'call history journal.' Users who no longer need scripts still want the record of their progress. Milestone badges and streaks reinforce continued engagement.
SpeakHints or adjacent product expands into pre-call scripting	**MEDIUM (12+ months)**	SpeakHints is in-call, not pre-call. But the space is active. Speed and brand ownership are the primary defenses. Launch fast.
Well-funded competitor copies after viral launch	**HIGH (12+ months)**	Build brand, build history data moat, build community. Name recognition in the anxiety/ADHD TikTok community is hard to copy quickly.
Claude API cost kills margins at scale	**LOW**	Scripts are short (~300 tokens output). API cost per script is <$0.02. At 60K users × 4 scripts/month = ~$5,000/month. Fully manageable at $4.99/month subscription revenue.

TikTok ban / platform risk	**LOW (ongoing uncertainty)**	Dual post to Instagram Reels + YouTube Shorts from day one. TikTok-first but not TikTok-only.

11. Build & Launch Roadmap

Phase	Timeline	Deliverables
0 — Validate	Week 1–2	Build a no-code / web prototype using Claude API. Post 3 TikToks using the Script Reveal format (faceless phone screen, type in problem, script appears). If any video breaks 50K views, the product is real. Measure response before writing a line of app code. If engagement is flat, iterate concept. Do NOT skip this step.
1 — MVP Build	Week 3–6	React Native app. Core flow + engineered onboarding (2 scripts in Session 1). Apple Intelligence differentiation screen on first launch. RevenueCat paywall. Sign in with Apple. App Store submission.
2 — Launch	Week 7–8	App Store approval. Launch TikTok content campaign. 5–7 videos/week. Test all 5 content formats. Watch which hits, double down. Monitor Session 1 paywall trigger rate — target 40%+ of installs hitting the paywall in Session 1.
3 — Growth	Month 3–6	Optimize paywall trigger rate. Add Confidence Tracker + Personas (Phase 2 features). Test annual plan. Begin micro-influencer outreach in anxiety/ADHD TikTok community.
4 — Scale	Month 6–12	Add Practice Mode. Launch Android. Track whether Confidence Tracker improves Day 30 retention above 8% baseline. Evaluate paid acquisition once organic CAC is known.
5 — Compound	Month 12–24	Phase 3 features. Team/family plans. Monitor Apple Intelligence releases for Writing Tools improvements that narrow Callmate's differentiation gap — adapt positioning if needed.

14. Naming, Brand & App Store

11.1 Name: Callmate

The name "Callmate" is chosen for its direct category association (phone), its emotional resonance (the ring itself is the anxiety trigger), and its memorability. The name is short, pronounceable, and searchable. Domain and App Store availability to be confirmed — alternates: Ringscript, Callscript, Dialcraft, Ringready.

11.2 App Store Positioning

- Primary Category: Productivity
- Secondary Category: Utilities
- Keywords: phone call anxiety, call script, calling anxiety, what to say on the phone, phone script generator, social anxiety app
- Subtitle (30 chars): "Your call, perfectly scripted"
- App Store rating target: 4.7+ — requires prompt-but-unforced rating request after a successful script use

11.3 Visual Identity Direction

- Color: Electric blue (confidence, communication, calm) + white
- Icon: Stylized phone receiver with a script/document element — clean, modern, not clinical
- Tone: Warm, confident, slightly witty. Anti-clinical. Anti-corporate.
- Tagline options: "Say exactly what you need to say." / "The call you've been avoiding, handled." / "Words when you need them most."

NEXT STEPS

1. Validate: Build a simple web demo and post 3 TikToks (Script Reveal format) this week.

2. Watch: If any video breaks 50K views, the product is real. If all three land flat, adjust concept.

3. Build: Only commit to full app development after validation signal. Engineering priority is the Session 1 paywall trigger — not features.

4. Launch: App Store submission in Week 6–7. Track Session 1 paywall hit rate from day one.

13. Adversarial Audit Summary

This PRD was updated following a full adversarial audit conducted after v1.0. The following table summarizes every finding and how it was addressed.

Finding	Severity	Resolution in PRD v1.1
Market demand confirmed real (40%+ of adults report phone anxiety across all generations)	✅ Positive	No change needed. Confirms the opportunity.
No direct incumbent app found for pre-call script generation	✅ Positive	Competitive analysis updated to reflect this accurately.
Apple Intelligence (iOS 18.1) is a partial free substitute — Writing Tools can rewrite text in Professional tone with ChatGPT	🔴 Critical	Added Apple Intelligence as HIGH-threat competitor. Added differentiation screen to MVP onboarding. Updated one-liner and exec summary. Updated moat strategy callout.
Retention projections in v1.0 were aspirational (12–25% D30). Industry benchmark for this category is 6–8% D30.	🔴 Critical	All metrics recalibrated to 6–8% D30. ARR scenarios revised downward to use realistic floor. Financial model still works at floor.
Paywall structure was passive (3 scripts over 30 days). Episodic use means most users churn before hitting the paywall.	🔴 Critical	Onboarding redesigned to burn 2 of 3 free credits in Session 1. Paywall fires during first session. Added Session 1 paywall hit rate as primary launch KPI.
SpeakHints (Product Hunt Dec 2025) is an adjacent competitor — real-time in-call suggestions	🟡 Medium	Added to competitive analysis. Different use case (in-call vs pre-call) — low direct threat but signals space is active.
'Use case solved' risk: users who improve stop needing the app	🟡 Medium	Added Confidence Tracker to Phase 2 features. Converts product from anxiety tool to call history journal with progression tracking.
ARR upside scenario (100K users, $5.99M) was unrealistic given retention floor	🟡 Medium	Upside scenario revised to 100K users / $5.40M — more conservative blended ARPU at scale.

AUDIT VERDICT

The concept survives adversarial review. Three critical issues were found and resolved: (1) Apple Intelligence is a real threat — addressed by structural differentiation and onboarding messaging. (2) Retention projections were too high — corrected to industry benchmarks; the business still works. (3) The paywall was passive — redesigned to fire in Session 1. All other risks were medium or lower.
